

# Package ‘htsr’

January 16, 2024

**Type** Package

**Title** Hydro-Meteorology Time-Series

**Version** 2.1.4

**Date** 2024-01-16

**Author** Pierre Chevallier [aut, cre]

**Maintainer** Pierre Chevallier <pierre.chevallier@mailo.com>

**Description** Functions for the management and treatment of hydrology and meteorology time-series stored in a 'Sqlite' data base.

**License** GPL-2

**Depends** R (>= 3.5.0)

**Imports** dplyr, ggplot2, purrr, readr, tibble, lubridate, stringr, fs,  
Rcpp, readxl, RSQLite, DBI, shiny, shinyFiles, waiter, WriteXLS

**Suggests** knitr, rmarkdown, RODBC, openair, editData, terra,  
directlabels

**Encoding** UTF-8

**RoxygenNote** 7.3.0

**VignetteBuilder** knitr

**LinkingTo** Rcpp

**URL** <https://github.com/p-chevallier/htsr>

**BugReports** <https://github.com/p-chevallier/htsr/issues>

**NeedsCompilation** yes

**Repository** CRAN

**Date/Publication** 2024-01-16 15:50:02 UTC

<code>ds_exp_hts</code>	<i>Extraction of a time-series from htsr data base</i>
-------------------------	--

---

## Description

The function display a web page allowing to extract a time-series in the "hts" format.

## Usage

```
ds_exp_hts()
```

## Details

Complete the requested information in the left panel, then press the submit button in order to extract the file. If you want to display the plot of the extracted file, choose "line" or "bar" and press the plot button.

When the subfunction "`d_exp_hts(fsq, sta,sen,rtime=FALSE,dstart=NA,dend=NA, rplot=FALSE)`" is used solely it returns a tibble tstab with 4 columns Date, Value, Station, Sensor. In this last subfunction fsq is the sqlite data base; sta, the station id, sen, the sensor id; rtime, dstart and dend define a time interval; rplot, the resulted plot.

## Value

The function returns a file (nomfic) with the following name: `<sensor.id>_<station.id>.hts`

## Author(s)

P. Chevallier - Oct 2017 - Sep 2023

ds\_inventory\_sensor     *Inventory of a station sensors of an htsr data base*

---

**Description**

The function display a web page in order to produce an inventory of the sensors for a selected station in an htsr data base.

**Usage**

```
ds_inventory_sensor()
```

**Details**

Complete the requested information in the left panel, then press the submit button. When finished press "done".

If "Output format" is "none", the results are displayed on the screen, If it is "xlsx", or "csv" (, as separator) or "csv2" (; as separator), the corresponding file with a sensor list is written.

**Value**

A table with the inventory of sensors of a selected station in the data base.

**Author(s)**

P. Chevallier - Jan 2024

---

ds\_inventory\_station     *Inventory of the stations of an htsr data base*

---

**Description**

The function display a web page in order to produce an inventory of the stations in an htsr data base.

**Usage**

```
ds_inventory_station()
```

**Details**

Complete the requested information in the left panel, then press the submit button. When finished press "done".

If "Output format" is "none", the results are displayed on the screen, If it is "xlsx", or "csv" (, as separator) or "csv2" (; as separator), the corresponding file with a station list is written.

**Value**

A table with the inventory of stations in the data base.

**Author(s)**

P. Chevallier - Dec 2023

---

ds\_sensor

*Create, Modify or Remove a sensor*

---

**Description**

Create, Modify or Remove a sensor.

**Usage**

ds\_sensor()

**Details**

If operation is Create, the fields Station, Table and Sensor are compulsory and cannot be modified afterwards.

Allowed entries for table are: WL (water levels), DI (discharges), QU (Quality), PR (precipitations), WE (weather).

If op is Create or Modify, the following text fields can be completed optionally: Nature, Description, Comment.

If op is Remove, all data corresponding to the sensor of the selected station are removed.

The data base is automatically backedup before any operation.

**Value**

Sensor created, modified or removed from the data base

**Author(s)**

P. Chevallier - Feb 2018-Sep 2023

ds\_station

*Create, Modify or Remove a station*

---

**Description**

Create, Modify or Remove a station.

**Usage**

ds\_station()

**Details**

If operation is Create, the fields Id\_Station, Type\_Station and Name (name\_st) are compulsory. The field Name can be modified afterwards.

If op is Create or Modify the following fields can be completed optionnaly: Country, Zone, Sub-zone, Large basin, Basin, Small basin, River, Longitude, Latitude, Altitude, Basin area, Manager.

If op is Modify, station type and station id cannot be modified. The sensors and data corresponding to the station are conserved.

If op is Remove, all data and sensors of the station are removed.

**Value**

Station created, modified ou removed from the data base

**Author(s)**

P. Chevallier - Jan 2018 - Sep 2023

---

d\_backup

*Backup a data base*

---

**Description**

Back a htsr sqlite data base

**Usage**

d\_backup(fsq)

**Arguments**

fsq                      Full name of the data base

**Value**

A saved data base with extension .bak

**Author(s)**

P. Chevallier - Jan 2019 / Nov 2020

---

d_compact	<i>Compact a data base</i>
-----------	----------------------------

---

**Description**

Compact htsr sqlite data base

**Usage**

```
d_compact(fsq)
```

**Arguments**

fsq                    Full name of the data base

**Value**

New data base or overwritten data base. Note that the created data base is empty.

**Author(s)**

P. Chevallier - Jan 2019

---

d_convert_hydraccess	<i>Convert a full Hydraccess database into a new htsr sqlite database (Windows only)</i>
----------------------	--

---

**Description**

Because the Hydraccess application only works into a Windows environment, this function cannot be applied on other platforms (Mas OS or Linux). Additionally, the R session must be configured in 32b (see the htsr-package vignette).

**Usage**

```
d_convert_hydraccess(fsq, db.hydraccess)
```

### Arguments

fsq                    Full name of the sqlite data base  
db.hydraccess        Full name of the hydraccess data base

### Details

If the specified sqlite data base already exists, a confirmation is requested to overwrite it.

An 32b ODBC Microsoft driver must be configured in the "administrative tools" and installed for the hydraccess data base. The correct functioning can be verified using the sub-function `u_test_rodbc(db.hydraccess)`, which must be successful.

### Value

A new or a replaced sqlite htsr data base.

### Author(s)

P. Chevallier - Nov 2018-Nov 2020

### See Also

[ds\\_inventory\\_station](#) and [ds\\_inventory\\_sensor](#) for displaying the content of the sqlite data base; [ds\\_exp\\_hts](#) for extracting a time-series.

### Examples

```
## Not run:  
  
d_import_hydraccess("foo.sqlite", "foo.mdb")  
  
## End(Not run)
```

---

d\_convert\_meteofrance\_d

*Convert a Meteo-France csv daily basic data file into a htsr sqlite base*

---

### Description

Convert a Meteo-France csv daily data file into a htsr sqlite base. It regards the "basic" data file, which includes precipitation, temperature and wind data. For other variables the function `d_convert_meteofrance_d1` shall be used with the corresponding csv file. The csv file shall be downloaded from <https://meteo.data.gouv.fr/> The name of the created sqlite file is the same as the csv file with an extension `.sqlite`.

**Usage**

```
d_convert_meteofrance_d(fmeteo)
```

**Arguments**

fmeteo            Full name of the Meteo-France csv file

**Details**

The sensors have an additional prefix d (as daily) in order to distinguish them from sensors with another time reference.

**Author(s)**

P. Chevallier - dec 2023 - jan 2024

---

d\_convert\_weewx            *Convert a weewx data base into a htsr sqlite base*

---

**Description**

Convert (or update) a weewx data base into a htsr sqlite base

**Usage**

```
d_convert_weewx(db.weewx, fsq = NA, update = TRUE, sta = NA, name_st = NA)
```

**Arguments**

db.weewx            Full name of the weewx data base  
fsq                  Full name of the htsr data base  
update              (default = TRUE)  
sta                  Station id (default = NA)  
name\_st             Station name (default = NA)

**Details**

If update is TRUE, sta and name\_st are unnecessary. If update is FALSE and fsq is NA, fsq is named "weewx.sqlite".

**Author(s)**

P. Chevallier - Feb 2018 - Sep 2023

**Examples**

```
## Not run:  
  
d_convert_weewx("weewx.sql", "foo.sqlite")  
  
## End(Not run)
```

---

d\_create

*Create a data base*

---

**Description**

Create htsr sqlite data base

**Usage**

```
d_create(fsq, cr_table = TRUE, bku = TRUE)
```

**Arguments**

fsq	Full name of the data base
cr_table	Create the basis tables : TRUE (default), FALSE
bku	Operate a backup if fsq exists : TRUE (default) / FALSE

**Details**

If the data base already exists and bku is TRUE, a backup is automatically generated.

If cr\_table is TRUE, The following tables are also created: ST (stations), SS (sensors), WL (water levels), DI (discharges), PR (Precipitations), WE (weather) and QU (quality)

**Value**

a new data base

**Author(s)**

P. Chevallier - Jan 2019

---

d\_exp\_discalib            *Export discharge measurements and calibrations from data base*

---

**Description**

Export discharge measurements and calibrations from data base

**Usage**

```
d_exp_discalib(fsq, sta, calib = TRUE, disp = TRUE)
```

**Arguments**

fsq	Full name of the data base
sta	Station Id.
calib	Calibration extraction TRUE (default)/FALSE
disp	Discharge measurement extraction TRUE (default)/FALSE

**Value**

a list of 2 tibbles, one with the calibration table and one with the discharge measurements

**Author(s)**

P. Chevallier - Sep 2017 - Nov 2020

**See Also**

[ds\\_exp\\_hts](#) for export time-series

---

d\_imp\_hts                *Import a hts file into a data base*

---

**Description**

Import a hts file into a tshm sqlite base

**Usage**

```
d_imp_hts(fsq, filein, table, bku = TRUE)
```

**Arguments**

fsq	Full name of the data base
filein	Full name of hts file to import
table	Table
bku	Automatic Backup TRUE (default) / FALSE

**Details**

The main table where the data have to be imported must be selected with one of the following abbreviation: WL (water level), DI (discharge), WE (weather), PR (precipitation) or QU (quality)  
If records already exist during the same interval, they are removed and replaced.

**Value**

Actualized data base

**Author(s)**

P. Chevallier - jan 2019-jan 2024

---

d\_rem\_hts

*Remove hts records from a data base*

---

**Description**

Remove hts records from a Sqlite base

**Usage**

d\_rem\_hts(fsq, table, sta, sen, start, end)

**Arguments**

fsq	Full name of the data base
table	Table
sta	Station id
sen	Sensor id
start	Start time of removed records
end	End time of removed records

**Details**

The main table where the data have to be removed must be selected with one the following abbreviation: WL (water level), DI (discharge), WE (weather), PR (precipitation) or QU (quality)

**Value**

Actualized data base

**Author(s)**

P. Chevallier - jan 2019 - dec 2022

---

d_table	<i>Create or remove a table of a htsr sqlite base</i>
---------	---

---

**Description**

The function allows to create or remove of a tshm sqlite base. If the base doesn't exist, it is created.

**Usage**

```
d_table(fsq, table, op = "C", bku = TRUE)
```

**Arguments**

fsq	Full name of the data base
table	Table name
op	Create (default) or Remove C/R
bku	Automatic Backup TRUE (default) / FALSE

**Details**

Possible table names : ST (Stations), SS (Sensors), WL (Water levels), DI (Discharges), WE, (Weather), PR (Precipitations), QU (Quality)

**Value**

Table created or removed

**Author(s)**

P. Chevallier - Jan-Feb 2018

**See Also**

- [ds\\_inventory\\_station](#) and [ds\\_inventory\\_station](#) to list the content of the base ;
- [ds\\_exp\\_hts](#) to extract a time-series

---

fc	<i>Short-cut for file.choose</i>
----	----------------------------------

---

**Description**

Short-cut for file.choose

**Usage**

fc()

**Value**

A filename

**Author(s)**

P. Chevallier

---

f_change_id	<i>Change Station id or Sensor id in a hts file</i>
-------------	---

---

**Description**

The function changes the station and/or the sensor id of a hts file. The new file is renamed with the new ids and a prefix n\_: nw\_<sensor.id>\_<station.id>.hts, BUT the eventual prefixes or suffixes of the original name are not conserved. The original file is not removed.

**Usage**

f\_change\_id(file, sta = NA, sen = NA, overwrite = FALSE)

**Arguments**

file	file to proceed
sta	new station id (default: NA)
sen	new sensor id (default: NA)
overwrite	TRUE / FALSE (default) if the output file exists

**Author(s)**

P. Chevallier - Nov 2017-Jan 2019

---

f_convert	<i>Convert an hts file in another format (xls, xlsx or csv) and vice-versa</i>
-----------	--

---

### Description

Converter in formats hts, xls, xlsx and text (csv et csv2)

### Usage

```
f_convert(file, form_start = "hts", form_end = "xlsx")
```

### Arguments

file	Hts file
form_start	Initial format ("hts" (default) or "xls" or "xlsx")
form_end	Final format ("hts" or "xls" or "xlsx" (default) or "csv" (separator , & decimal .) or "csv2" (separator ; and decimal ,)

### Details

'form\_start' = csv or csv2 is for instance not accepted. It could be converted previously in xls or xlsx format.

### Value

A file in the requested format with 4 columns: Date, Value, Station, Sensor

### Author(s)

P. Chevallier - October 2017 - May 2022

### Examples

```
## Not run:  
f_convert(file, "xlsx", "hts")  
  
## End(Not run)
```

---

f\_csv\_multivar      *Build a multivariable table file in csv format*

---

**Description**

Build a multivariable table file in csv format

**Usage**

```
f_csv_multivar(files, daily = TRUE, fileo = "fileo")
```

**Arguments**

files	list of hts files
daily	default = TRUE
fileo	name of the output file (without extension)

**Details**

The function build a cvs file with values extracted from several hts files at the same date. So, it's better to run 'h\_common' before to apply 'f\_csv\_multivar'

If daily is TRUE, only the date is taking into account, not the time.

**Value**

A csv table, where the first field is a date and the next fields values

**Author(s)**

P. Chevallier - Jan-Feb 2022

---

f\_month2day      *Interpolation of daily records from a monthly time series*

---

**Description**

Interpolation of daily records from a monthly time-series

**Usage**

```
f_month2day(file)
```

**Arguments**

file	monthly time series to process
------	--------------------------------

**Details**

The function build and interpolated daily time-series from a monthly one. The daily values are linearly computed between two consecutive monthly values.

**Value**

a daily time series

**Author(s)**

P. Chevallier - dec 2022

---

f_properties	<i>Properties of a hts series</i>
--------------	-----------------------------------

---

**Description**

The function provides the properties of a time-series, its duration and the inventory of its gaps

**Usage**

```
f_properties(file, gaps = FALSE)
```

**Arguments**

file : file to be analyzed  
gaps : produce a file with a table of the gaps: TRUE / FALSE (default)

**Details**

If gaps = TRUE, a file is produced, with the same name of file and the extension .gap. It contents a table with the gaps of the series and allows to build a plot with the function [p\\_gaps](#).

**Value**

Basic infos on a hts time-series

**Author(s)**

P. Chevallier - Jan 2019 - Oct 2021

**See Also**

[p\\_gaps](#).

---

hs_tstep	<i>hts time series with fixed timestep</i>
----------	--

---

### Description

Computes time-series with a fixed timestep from infra-daily to monthly within a shiny web page.

### Usage

```
hs_tstep()
```

### Details

First of all, one must select a "starting" hts file, instantaneous or already with a fixed timestep.

Then one must choose the computing time-step and mode, between the possible choices. Note that the timezone considered is the timezone of the "starting" file.

Possible time-steps are: 5, 10 or 30 minutes, 1, 2, 3, 6 or 12 hours, 1 day, 1 month. It shall be noted that when computing the monthly time step, the daily time step is previously computed.

Possible modes are: average, sum, max or min. For monthly time step, max and min offers two options: daily max averages, respectively min, or absolute, respectively min.

In the case of a daily timestep, a shift value (in hours) allows to shift the time interval. For example if shift = 6, the date is computed from 6am until 6am the following day. The result is dated in the middle of the interval, i.e. if shift = 6; the datetime is 18.

In the case of a monthly timestep, associated additional time series can be optionally computed:

- A mean monthly climatology, taking into account or not the missing daily values with the option "remove NA". Climatology files are by convention awarded to year 2000.
- Excel files: with a calendar presentation (days in rows, months in columns, years in sheets): option caledit\_j ; with the monthly means (or sums): option caledit\_m.
- Missing values can be replaced by the mean of the existing values for other years: option gapfill.
- Extract year stat

The output files are written in same folder as the starting hts file.

### Value

hts files at the requested timestep with a suffix giving the timestep in minutes, i.e. 1440 for the daily timestep. In the case of monthly timestep, the suffixes are: M for the current case, C for the climatology, G for the gapfilled file.

Optionally, two Excel files with values in "calendar form": one with daily data and one with monthly data, the first one with a ad\_ prefix and the second one with the am\_ prefix.

### Author(s)

P. Chevallier - Oct 2017 - Sep 2023

---

h_addna	<i>Add NA values within a time series</i>
---------	---

---

**Description**

Add NA values within a time series

**Usage**

```
h_addna(file, add)
```

**Arguments**

file	File name to proceed
add	List of dates with NA values to be added

**Details**

The function adds records with NA in a time series at given dates. If the date already exists, the value is replaced by NA

The output file is named with a nap\_ prefix.

**Author(s)**

P. Chevallier - November 2022

**Examples**

```
## Not run:  
f <- h_addna (f, add = c("2021-01-01 12:00:00 UTC", "2031-01-01 12:00:00 UTC"))  
## End(Not run)
```

---

h_adjust	<i>Adjust a time series to a statistical model</i>
----------	--

---

**Description**

Adjust a time series to a statistical model

**Usage**

```
h_adjust(file, time_unit = "year")
```

**Arguments**

file            File to proceed  
time\_unit      to be chosen in: "100y", "year", "month", "day"

**Details**

The function adjust a time series with a statistical model. For instance it works only with a linear model.

"year" corresponds to an average year of 365.25 days and month to an average month of 30,4575 days.

**Author(s)**

P. Chevallier - January 2024

---

h\_avday                      *Daily average over a sequence of several years*

---

**Description**

Daily average over a sequence of several years

**Usage**

```
h_avday(file, start = NA, end = NA, mhy = 1, precip = FALSE, dig = 1)
```

**Arguments**

file            File name to proceed  
start          Starting date (default = NA)  
end            Ending date (default = NA)  
mhy            Starting month of the hydrological year (default = 1)  
precip        Precipitation time series (default = FALSE)  
dig            Number of significant digits for Value (default = 1)

**Details**

The function means the values of each calendar day over a period larger than 4 years (i.e. it includes at least one Feb 29 day). The result is transferred to the last possible hydrological year of the interval.

In the special case of precipitation, where the distribution is discontinuous over time, the original values of the last hydrological year are replaced by values corrected proportionately.

**Author(s)**

P. Chevallier - Nov 2022

**Examples**

```
## Not run:  
  
f <- h_avday(f, start=NA, end=NA, mhy=10, precip=TRUE, dig=1)  
  
## End(Not run)
```

---

h_changetz	<i>Change the time zone of a time series</i>
------------	--

---

**Description**

Change the time zone of a time series

**Usage**

```
h_changetz(file, tz1 = "UTC", tz2 = "Europe/Paris")
```

**Arguments**

file	File name to proceed
tz1	original time zone (default = "UTC")
tz2	new time zone (default = "Europe/Paris")

**Details**

The output file is named with a tz prefix.

**Author(s)**

P. Chevallier - June 2023

---

h_common	<i>Extract 2 (or more) time-series on their common period</i>
----------	---

---

**Description**

The fonction extract the data of 2 (or more) hts time-series for the common date/time records (precision of the second).

**Usage**

```
h_common(files)
```

**Arguments**

files            List of file names to process.

**Value**

hts files resulting of the operation; their names are composed as: co\_<original filename>

**Author(s)**

P. Chevallier - Oct 2017 - Oct 2023

**Examples**

```
## Not run:
f <- h_common(files = c("foo1.hts", "foo2.hts"))

## End(Not run)
```

---

h\_condition

*Conditional extraction of a time-series regarding another one*

---

**Description**

The series to proceed is the first of the list, the conditional series the second. Only the common record dates are kept.

**Usage**

```
h_condition(files, condition)
```

**Arguments**

files            Liste de 2 file names  
condition        Liste 3 objects : oper ("sup" or "inf" or "between"), thrhd1 < thrhd2 ; default is c("inf",0,NA)

**Details**

If the condition on the file 2 value is not respected, the value of file 1 is changed as NA.

The condition has 3 options :  $x <$  ("inf"),  $x \geq$  ("sup"),  $< x \leq$  ("between"). In case of error or by default, "inf" is considered. In the cases "inf" and "sup", only one threshold is used (thrhd1) ; in the case "between", two thresholds are needed (thrhd1 < thrhd2).

The output file is the name of the fist file with a cd\_ prefix.

**Author(s)**

P. Chevallier - Oct 2017-Jan 2019

**Examples**

```
## Not run:  
  
f <- h_condition(c(f1,f2), c("between", 0, 2))  
  
## End(Not run)
```

---

h_cumul	<i>Cumul of time-series</i>
---------	-----------------------------

---

**Description**

The function returns a time-series of cumulated values. If the value is negative, the absolute value is taken. It is possible to limit the computation time interval. NA values are ignored.

**Usage**

```
h_cumul(file, start = NA, end = NA)
```

**Arguments**

file	File name to proceed
start	Start date, default = NA
end	End date, default NA

**Details**

The output file is named with a cu\_ prefix.

**Author(s)**

P. Chevallier - Oct 2017-Jan 2019

**Examples**

```
## Not run:  
  
f <- h_cumul(f, start="2012-1-1", end = "2013-1-1")  
  
## End(Not run)
```

---

h\_gaperr *Replace errors with gaps in a time-series based on neighboring values*

---

### Description

Replace errors with gaps in a time-series based on neighboring values

### Usage

```
h_gaperr(file, nv = 1, itv0 = 43201, df)
```

### Arguments

file,	File name to proceed
nv	Number of below and above neighboring values to take into account, default = 1
itv0	Threshold of minimum time gap (see function h_gaprem_itv)
df	Deviation value factor for testing if a value is correct or not

### Details

Replace errors with gaps in a time-series based on neighboring values

### Value

a time-series file with the prefix eg\_

### Author(s)

P. Chevallier - Nov 2019

---

h\_gapfill *Simple gapfilling in a time-series*

---

### Description

Simple gapfilling in a time-series

### Usage

```
h_gapfill(file, npdt)
```

### Arguments

file	File name to proceed
npdt	Number of time-steps

**Details**

Replace the missing values with the linear interpolated value within the gap interval, when the time interval is less than a number of fixed time steps.

CAUTION! this operation is only possible when the time-series has a fixed time-step.

**Value**

a time-series file with the prefix gf\_

**Author(s)**

P. Chevallier - Nov 2017 - Nov 2021

---

h\_gaprem\_itv

*Remove gaps in a time-series with a time interval threshold*

---

**Description**

Remove gaps in a time-series with a time interval threshold

**Usage**

```
h_gaprem_itv(file, itv0 = 43201)
```

**Arguments**

file	File name to proceed
itv0	Time threshold in seconds, default = 43201 (i.e 12 hours)

**Details**

Remove the missing values when the time interval between the previous and the next record is less than a fixed threshold

**Value**

a time-series file with the prefix gr\_

**Author(s)**

P. Chevallier - Nov 2019

---

h\_nodata

*Replace values with NA conditionally or in a time interval*

---

**Description**

Replace values with NA conditionally or in a time interval

**Usage**

```
h_nodata(file, threshold = NA, test = "=", start = NA, end = NA)
```

**Arguments**

file	File name to proceed
threshold	Threshold value (default = NA)
test	Test "=" (default); "<"; "<="; ">"; ">="
start	Start date/time (included) of POSIXct class (default = NA)
end	End date/time (excluded) of POSIXct class (default = NA)

**Details**

The function replace values with NA conditionally or introduce a gap for a given interval.

For the conditional option, the start parameter must be NA. A conditional test is applied on the values (= ; > ; >= ; < ; <=) with a fixed threshold returning NA if the test is verified.

For the gap option, the threshold parameter must be NA. All the values of the records within the interval start end are replaces by NA.

CAUTION ! At least one of both parameters threshold or start must not be NA. NA.

The output file is named with a na\_ prefix.

**Author(s)**

P. Chevallier - Oct 2017-Jan 2019

**Examples**

```
## Not run:

f <- h_nodata(f, threshold=10., test= "<=", start=NA)

## End(Not run)
```

---

h_rainsnow	<i>Share the solid and liquid precipitations with a temperature criteria</i>
------------	--

---

**Description**

The precipitations are shared with a linear bevel between two temperature values

**Usage**

```
h_rainsnow(fpr, fta, ta0, ta1, sta = NA)
```

**Arguments**

fpr	Precipitation file name
fta	Temperature file name
ta0	Low temperature threshold
ta1	High temperature threshold
sta	Station id. (default = NA)

**Details**

The two time-series must be previously restricted to the same interval of time.

The two temperature thresholds can be equal.

The temperature time-series must be complete with no gap. Gaps are allowed in the precipitation time-series.

If the station id is NA, the station id of the file fta is used.

**Value**

2 hts files, one with the liquid precipitation (prefix rn\_) and one with the solid precipitation (prefix sn\_).

**Author(s)**

P. Chevallier - Oct 2017- Feb 2019

---

`h_rbind`*Bind 2 time-series on consecutive periods*

---

**Description**

The fonction binds the data of 2 hts time-series for consecutive date/time records (precision of the second) of the same station.

**Usage**

```
h_rbind(files, sensor = "NewS", gap = TRUE)
```

**Arguments**

<code>files</code>	List of char, File names to process.
<code>sensor</code>	New sensor name of the resulting hts file (default ="NewS")
<code>gap</code>	Introduce or not a gap between both series (default = TRUE)

**Details**

In the list, the files must be ordered from the oldest to the newest. If `gap` is TRUE, a gap is introduced between both series.

**Value**

hts file resulting of the operation; its names are composed as: `<sensor>_<station>.hts`, with the prefix `na`, if a gap has been introduced.

**Author(s)**

P. Chevallier - Mar-Nov 2020

**Examples**

```
## Not run:  
  
f <- h_bind(files = c("foo1.hts", "foo2.hts"), sensor = "NewOne")  
  
## End(Not run)
```

---

h_replace	<i>Replace a value by another</i>
-----------	-----------------------------------

---

**Description**

Replace a value by another

**Usage**

```
h_replace(file, old.val, new.val)
```

**Arguments**

file	File name to proceed
old.val	Value to be replaced
new.val	New value

**Details**

The output file is named with a re\_ prefix.

**Author(s)**

P. Chevallier - Oct 2017- Nov 2020

**Examples**

```
## Not run:  
  
f <- ts_replace_ts(f, NA, 0)  
  
## End(Not run)
```

---

h_restrict	<i>Restrict a series between 2 dates</i>
------------	--

---

**Description**

Restrict a series between 2 dates

**Usage**

```
h_restrict(file, start = NA, end = NA)
```

**Arguments**

file	File name to proceed
start	Start date/time (included) of POSIXct class (default = NA)
end	End date/time (excluded) of POSIXct class (default = NA)

**Details**

The output file is named with a rs\_ prefix.

**Author(s)**

P. Chevallier - Nov 2017-Jan 2019

---

h_rollav	<i>Rolling average of a daily time-series</i>
----------	---

---

**Description**

The function compute a rollong average of daily time-series values. NA values are removed.

**Usage**

```
h_rollav(file, ti = 7, position = "central")
```

**Arguments**

file	File name to proceed
ti	Time interval of computation in days (default = 7)
position	Position "central" or "right"

**Details**

The output file is named with a ro\_ prefix. The computation can considers the values before and after the current time step (position = "central") or the values before the current time step. If the position is "central", the position must be an odd integer.

**Author(s)**

P. Chevallier - Apr 2020

---

h_season	<i>Seasonal selection</i>
----------	---------------------------

---

**Description**

The function provides seasonal time-series.

**Usage**

```
h_season(file, monthstart)
```

**Arguments**

file	Full file name to proceed
monthstart	List of 2 to 4 integers (between 1 and 12) giving the starting month of each season.

**Details**

2 to 4 seasons can be selected. For each season, the prefix `sx_` where `x` is the season is added to the file name.

**Value**

list of file names for each seasonal time-series.

**Author(s)**

P. Chevallier - Oct 2017 - Mar 2020

**Examples**

```
## Not run:  
  
files <- h_season("foo.hts", monthstart=c(3,6,9,12))  
  
## End(Not run)
```

---

h_stat_basic	<i>Basic statistics of a time-series</i>
--------------	--

---

**Description**

Compute the main statistic parameters of a time-series

**Usage**

```
h_stat_basic(files)
```

**Arguments**

files            vector of file names to process

**Value**

a tibble with the basic stats of the files.

**Author(s)**

P. Chevallier - Oct 2017 - Feb 2022

**Examples**

```
## Not run:  
simplestat <- h_stat_basic(c("foo1.hts", "foo2.hts")  
  
## End(Not run)
```

---

h_substitute	<i>Substitute the missing values in a series by existing values of another series</i>
--------------	---

---

**Description**

The series to proceed (first in file list) contents missing values or gaps to be replaced by those of the second series (second in file list).

The function only works on the common dates of both series.

**Usage**

```
h_substitute(files)
```

**Arguments**

files            List of two file names

**Details**

The output file is named with a sb\_ prefix.

**Author(s)**

P. Chevallier - Feb 2017 - Mar 2020

**Examples**

```
## Not run:  
  
f <- h_substitute(c(f1, f2))  
  
## End(Not run)
```

---

h_weightedsum	<i>Weighted sum of time-series</i>
---------------	------------------------------------

---

**Description**

The function only works on the common period of the files without NA values. It operates weighted sums on one or several time-series. It is also possible to add a constant.

**Usage**

```
h_weightedsum(files, weights, constant = 0)
```

**Arguments**

files            List of file names to proceed  
weights         List of weights (must have the same length as files)  
constant        Constant to add (default = 0)

**Details**

For averaging n time-series one can use n weights wit a value of 1/n and constant = 0.

**Value**

The function returns + n hts files with the extracted common period + 1 hts file named as the first file of the list with the prefix w\_. The sensor id is automatically set to "weighted".

**Author(s)**

P. Chevallier - Oct 2017-Oct 2021

**Examples**

```
## Not run:

# choose time-series f1, f2, f3
f1 <- "foo1.hts" ; f2 <- "foo2.hts" ; f3 <- "foo3.hts"
# the new f time-series contains records f[i] = f1[i] - (0.5 * f2[i]) + (0.5 * f3[i]) + 5
f <- h_weightedsum(c(f1,f2,f3), c(1,-0.5,0.5)), 5)
# the new f time-series contains records f[i] = (1.12 * f1[i]) + 3
f <- h_weightedsum(f1, 1.12, 3)

## End(Not run)
```

---

h\_wl\_di

*Computation of the discharges from water-levels*

---

**Description**

Computes a discharge time-series from water levels data and calibration curves

**Usage**

```
h_wl_di(fsq, sta, seni, seno, dstart = NA, dend = NA, dbo = TRUE)
```

**Arguments**

fsq	htsr data base
sta	Station Id.
seni	Input sensor Id (water levels)
seno	Output sensor Id (discharges)
dstart	Start date (NA by default)
dend	End date (NA by default)
dbo	Includes the result in the data base (TRUE by default)

**Details**

Calibration curves must exist in the data base.

If 'dbo' is TRUE, a discharge table "DI" and the sensor 'seno' must exist in the data base. The new discharge time-series overwrites the already existing data ; however, it is asked to confirm the operation. In any case the data base is previously backed up.

**Value**

Writes an hts file with the resulting discharges and optionally includes it in the data base.

**Author(s)**

P. Chevallier - Dec 2020 - Sep 2023

**See Also**

The functions [ds\\_exp\\_hts](#) and [d\\_imp\\_hts](#) are used for export the water levels, respectively import the discharges within the data base. The function [u\\_exp\\_discalib](#) included in [p\\_discalib](#) is used for loading the calibration curves.

---

h_year	<i>Annual time series</i>
--------	---------------------------

---

**Description**

Annual time series

**Usage**

```
h_year(file, mhy = 1, op = "M", dig = 1)
```

**Arguments**

file	File name to proceed
mhy	Starting month of the hydrological year (default = 1)
op	Sum (S) or Mean (M) (default = "M")
dig	Number of significant digits for Value (default = 1)

**Details**

The function computes an annual time-series using the annual mean or the annual sum of daily values. It allows the use of hydrological years. The date corresponds to the middle of the year, i.e. the 182th day.

**Value**

The function returns a time-series of annual values.

**Author(s)**

P. Chevallier - Nov 2022

---

`ps_plothts`*Plot hts files*

---

## Description

This function allows to plot one or several time series files using a shiny web page

## Usage

```
ps_plothts()
```

## Details

When launched, a shiny window is open. Follow the instructions, divided in 5 steps.

1. Select hts files (8 max) pressing "File select". They must be located in the same folder. When done, press "Enter file settings"
2. For each file, if needed, use the "Edit" tab to configure label, line.type, line.with, point.shape and point.size. (The values follows the ggplot2 package conventions). When done, press "Save file settings"
3. Configure the general layout of the file, entering Title and y-Axis label and choosing a color palette. Several options are available: set y-Axis scale, set time interval, point plot(\*), display normalized values, draw a trend line, or display the plot as horizontal facets. When done, press "Save plot settings"
4. Pressing "Plot" displays the graph. You can chose a line or bar graph. When the graph is finalized, check the box "save plot". Three formats are allowed: .png, .jpeg or pdf. The resolution is 300 dpi. Then, press "Save plot settings". The plot is saved in the folder of the selected files.
5. When finished, press "Done".

Items 2 and 3 can be performed and repeated in any order. Once they have been validated once, item 4 can be executed as often as desired.

(\*) When point plot is selected, the points overlay the line (point plot doesn't work with bar). If you want only the points on the plot, configure "line.type" and "line.width" = 0.

## Author(s)

P. Chevallier - Apr 2015 - Sep 2023

---

p\_box\_month                      *Boxplot of the 12 months of a time-series.*

---

### Description

Boxplot of the 12 months of a time-series.

### Usage

```
p_box_month(  
  file,  
  title = "Title",  
  axeY = "Y-axis",  
  savefig = FALSE,  
  fileo = "plot.png",  
  width = 8,  
  height = 6  
)
```

### Arguments

file	File name of the time-series
title	Title plot (default = Title)
axeY	Title of y-axis (default Y-axis)
savefig	Save plot file TRUE / FALSE (default)
fileo	Name of the plot file with extension png, jpg or pdf
width	Plot width (x 100 pixels), default = 8
height	Plot heights (x 100 pixels), default = 6

### Value

A ggplot2 object

### Author(s)

P. Chevallier - Nov 2017 -Feb 2019

---

p\_clim *Plot climatologies in hydrological year*

---

### Description

This function processes climatology hts files created with [hs\\_tstep](#).

### Usage

```
p_clim(
  files,
  type = "line",
  hydro.month = 1,
  title = "Title",
  yaxis = "Value",
  y.down = NA,
  y.up = NA,
  rpal = FALSE,
  pal = mapalette,
  legend.l = NA
)
```

### Arguments

files	List of climatology file names
type	Type: "line" (default) or bar"
hydro.month	Starting month or the hydrological year (default = 1)
title	Title of the plot (default = "Title")
yaxis	Title of y-axis (default = "Value")
y.down	Down limit of y-axis (default = NA)
y.up	Up limit of y-axis (default = NA)
rpal	Choice of a color palette TRUE/FALSE(default)
pal	Color choice or mapalette (default)
legend.l	List of text to be displayed in the plot legend (default = NA)

### Details

The parameter tyoe allows to display a line graph or a bar graph.

The parameter hydro.mont fixes the starting month of the hydrological year.

The y-axis scale can be fixed with y.down and y.up.

By default, the color palette is the R one. It can be change with a color list in the pal parameter or choosing mapalette (default in pal)

Par default station\_sensor ids are displayed in the legend.l list. But it can be changed entering a list of texts in legend.l,, which must have the same length as the file number.

**Value**

A ggplot2 object.

**Author(s)**

P. Chevallier - Feb 2017 - Sep 2023

---

p\_discalib

*Plot calibration curves water levels vs discharges*

---

**Description**

Experimental function, which is for instance limited to only two calibration curves on the same plot.

The function plot the discharges measurements and the corresponding calibration curves starting.

Only the "active" discharge measurements are plotted. The parameter plotdism displays them or not.

One can zoom on a subpart of the plot using the limit values on the x and y axis.

The savefig (default = FALSE by default) parameter allows to save the result i a png, jpg or pdf file, according to the extension of fout.

**Usage**

```
p_discalib(  
  fsq,  
  sta,  
  sen = "IH",  
  plotcalib = TRUE,  
  plotdism = TRUE,  
  title = "Title",  
  savefig = FALSE,  
  width = 8,  
  height = 6,  
  fout = "plot.png",  
  limx = FALSE,  
  limy = FALSE,  
  xinf = NA,  
  xsup = NA,  
  yinf = NA,  
  ysup = NA  
)
```

**Arguments**

fsq	Data base file name
sta	Station Id.
sen	Sensor Id. (default = "IH")
plotcalib	Plot calibrations TRUE (default) / FALSE
plotdism	Plot discharge measurements TRUE (default) / FALSE
title	Plot title (default: Title)
savefig	Save plot in a png file TRUE (default) / FALSE
width	Plot width (x 100 pixels) (default = 8)
height	Plot height (x 100 pixels) (default = 6)
fout	Plot file name (default = "plot.png")
limx	Limit x axis TRUE / FALSE (default)
limy	Limit y axis TRUE / FALSE (default)
xinf	Low value for x (default = NA)
xsup	High value for x (default = NA)
yinf	Low value for y (default = NA)
ysup	High value for y (default = NA)

**Author(s)**

P. Chevallier - Sep 2017 - Dec 2020

---

p\_gaps

*Plot of data inventory*

---

**Description**

This function plot an inventory of the data from one or several station(s)-sensor(s). It is based on the .gap files provided by the function [f\\_properties](#). It allows to highlight the gaps in time-series.

**Usage**

```
p_gaps(files, title = "Inventory", BW = FALSE, margin = 0.1)
```

**Arguments**

files	List of series to plot (hts files)
title	Plot title, default is "Inventory"
BW	Black & white plot TRUE / FALSE (default)
margin	Reserved space for label writing - default is 0.1

**Details**

The inventories are represented with lines displayed bottom-up in the order of the files list. They are labeled with the station\_sensor ids.

Colors are the default colors of ggplot2. For a black & white plot, precise `BW = TRUE`

The margin value is a reserved space for writing the label at the end of each line. Default value is 0.1 of the difference between the minimum and the maximum date. It shall be adjusted following the length of the labels.

**Value**

A ggplot2 object

**Author(s)**

P. Chevallier - Nov 2017 - Sep 2023

**See Also**

[f\\_properties.](#)

---

p\_hypso

*Plot the hypsometry curve of one or more basins*

---

**Description**

Plot the hypsometry curve of one or more basins

**Usage**

```
p_hypso(  
  file,  
  abbrev,  
  prop = FALSE,  
  range = 50,  
  fact = 5,  
  title = "Title",  
  savefig = FALSE,  
  width = 8,  
  height = 6,  
  fileo = "plot.png"  
)
```

**Arguments**

file	Raster file list of elevation model of basin(s)
abbrev	List of abbreviated basin name(s)
prop	TRUE / FALSE (default) plot a proportion curve of altitude ranges
range	Width of altitude range (default = 50m)
fact	Exagerating factor of the areas (default=5)
title	Title of the plot (default = Title)
savefig	Save the plot in png (default FALSE)
width	Plot width (x 100 pixels) (default = 8)
height	Plot height (x 100 pixels) (default = 6)
fileo	Name of plot file with extension (default = "plot.png")

**Value**

An object of ggplot2 class

**Author(s)**

P. Chevallier - Sep 2017- Jun 2023

---

p\_scatter

*Scatter plot of 2 or more time-series*

---

**Description**

The reference time-series is the first of the list. The scatter plot regards only the common dates of the series. In addition to the plot, a linear function is adjusted forcing or not the interception by the origin.

**Usage**

```
p_scatter(
  files,
  intercept.zero = FALSE,
  remove.zero = FALSE,
  lg.axis = c(NA, NA),
  title = "Title"
)
```

**Arguments**

files	List of file names to proceed
intercept.zero	TRUE/FALSE (default) force the interception by origin
remove.zero	TRUE / FALSE (default) remove the records with Value = 0 (e.g. precipitations)
lg.axis	Legend list for axis x & y (default = NA)
title	Title of the plot (default: Title)

**Value**

a table named "result" with 5 columns : variable name, size of the sample, correlation coefficient, regression line slope, interception

**Author(s)**

P. Chevallier - Oct 2017-Apr 2023

**Examples**

```
## Not run:  
  
result <- p_scatter(files = c("foo1.RData","foo2.RData"),  
                    intercept.zero = TRUE)  
  
## End(Not run)
```

---

p_wind	<i>Plot wind roses</i>
--------	------------------------

---

**Description**

Plot wind roses

**Usage**

```
p_wind(  
  fsq,  
  sta,  
  swd,  
  swv,  
  ws.int = 0.5,  
  angle = 45,  
  grid.line = 10,  
  type = "default",  
  breaks = 5,  
  offset = 5,  
  paddle = FALSE,  
  key.position = "right"  
)
```

**Arguments**

fsq	Full name of the htsr data base
sta	Station id
swd	Id of wind direction sensor

swv	Id of wind speed sensor
ws.int	Size of speed intervals
angle	Value in percent of the range unit
grid.line	Value in percent of the grid line frequency
type	Type of plot: "default", "year" or "month"
breaks	Number of speed intervals
offset	Size in percent of the central hole
paddle	Shape of the basic elements: if FALSE, polar, if TRUE, rectangular
key.position	Position of the legend

**Details**

For a detailed description of all parameters see [windRose](#)

**Value**

A wind rose plot

**Author(s)**

P. Chevallier - Dec 2019 - Sep 2023

**See Also**

[windRose](#)

---

u_index	<i>Compute an index of community</i>
---------	--------------------------------------

---

**Description**

Compute an index of community

**Arguments**

nz	length of the concatenated time-series
yd	initial vector of datetimes (in sec)

**Details**

the function compute an index, which the number of apparition of the same datetime in a time-series

**Value**

vector of indexes

**Author(s)**

P. Chevallier - Apr - Oct 2023

---

`u_timestep`*Compute values in a time-series with a fixed timestep*

---

**Description**

Compute values in a time-series with a fixed timestep

**Arguments**

<code>te</code>	time end (in sec)
<code>yd</code>	initial vector of datetimes (in sec)
<code>yv</code>	initial vector of values
<code>tst</code>	timestep (in mn)
<code>iop</code>	operation index

**Details**`iop = 1` for sum; `0` for mean; `-2` for min and `+2` for max**Value**

vector of values with fixed timestep

**Author(s)**

P. Chevallier - June / Oct 2023

---

`w_atmp_alt`*Compute atmospheric pressure, function of altitude*

---

**Description**

Compute atmospheric pressure, function of altitude

**Usage**`w_atmp_alt(f_atmp, f_temp, alt)`

**Arguments**

f_atmp	File name of the known atmospheric pressure ts (mb)
f_temp	File name of the air temperature at the known altitude (°C)
alt	Altitude of the computed air- temperature ts (m)

**Details**

The function computes an atmospheric pressure time-series at a given altitude, based on a known atmospheric pressure time-series at the sea level. It also needs the air temperature time-series at the sea level for the same times.

In order to verify that both time-series correspond, it is strongly recommended to run previously the function [h\\_common](#).

**Value**

An hts file with the suffixe `_alt`

**Author(s)**

P. Chevallier - Nov 2021 / Nov 2022

---

w\_etsp

*Compute the potential evapotranspiration with several methods*

---

**Description**

ETP calculation

**Usage**

```
w_etsp(  
  method = c("Turc", "Penman-Monteith", "Priestley-Taylor", "Makkink",  
            "Heargraves-Samani"),  
  freq = c("day", "month"),  
  f_temp,  
  f_relh = NA,  
  f_radg = NA,  
  f_radn = NA,  
  f_atmp = NA,  
  f_wvel = NA,  
  f_tmin = NA,  
  f_tmax = NA,  
  lat = NA,  
  alt = NA,  
  albedo = NA,  
  z = NA  
)
```

**Arguments**

method	Method "Turc", "Penman-Monteith", "Priestley-Taylor", "Makkink", "Heargraves-Samani"
freq	Frequency "day", "month"
f_temp	File of air temperature in degC, mandatory
f_relh	File of relative humidity in percent, mandatory
f_radg	File of global radiation in W/m2
f_radn	File of net radiation in W/m2
f_atmp	File of atmospheric pressure in hPa
f_wvel	File of wind velocities in m/s
f_tmin	File of air min temperature in degC
f_tmax	File of air max temperature in degC
lat	Latitude in deg
alt	Altitude in m
albedo	Albedo
z	Anemometer high in m

**Details**

f\_temp and f\_relh are mandatory in all cases.

For the Turc method, f\_radg is needed.

For the Penman-Monteith method, f\_atmp, f\_wvel, h and z are needed. If f\_radn is not available, lat, f\_tmin and f\_tmax are also needed.

The Turc method only works with a monthly frequency.

**Value**

An hts files resulting of the operation with a name composed as:

<J or M><EtpTu>\_<Station\_id>.hts for the Turc method,

<J or M><EtpPM>\_<Station\_id>.hts for the Penman-Monteith method,

<J or M><EtpPT>\_<Station\_id>.hts for the Priestley-Taylor method

<J or M><EtpMa>\_<Station\_id>.hts for the Makkink method

<J or M><EtpHS>\_<Station\_id>.hts for the Heargraves-Samani method

w\_spechum2relhum      *Convert specific humidity to relative humidity*

---

**Description**

Convert specific humidity to relative humidity

**Usage**

w\_spechum2relhum(f\_spechum, f\_temp, f\_atm)

**Arguments**

f_spechum	file of specific humidity, dimensionless (e.g. kg/kg) ratio of water mass / total air mass
f_temp	file of temperature degrees C
f_atm	file of atmospheric pressure in mb

**Details**

Converting specific humidity into relative humidity. from Bolton 1980 The computation of Equivalent Potential Temperature

**Value**

a file of relative humidity, ratio of actual water mixing ratio to saturation mixing ratio

**Author(s)**

P. Chevallier - Nov 2022

---

`w_temp_alt`*Compute temperature, function of altitude*

---

**Description**

Compute temperature, function of altitude

**Usage**

```
w_temp_alt(file, alt0 = 0, alt, grad = -0.0065)
```

**Arguments**

<code>file</code>	File name of the known air temperature ts (°C)
<code>alt0</code>	Altitude of the known air temperature ts - default = 0 (m)
<code>alt</code>	Altitude of the computed air- temperature ts (m)
<code>grad</code>	Temperature gradient vs elevation - default = -0.0065 (°C/m)

**Details**

The function computes an air temperature time-series at a given altitude, based on a known air temperature time-series at a known altitude.

**Value**

An hts file with the suffix `_<alt>`

---

`z_coord`*Coordinate utility*

---

**Description**

Convert numeric coordinates in character coordinates

**Usage**

```
z_coord(ncoord = NA, ccoord = NA, type)
```

**Arguments**

ncoord	Numeric coordinate
ccoord	Character coordinate
type	Lat / Lon

**Details**

Only one of both parameters ncoord (numeric) and ccoord (character) must be filled, the other one remaining NA. The type of coordinate (Lat or Lon) is compulsory.

The character coordinate must be organized in one string with 4 fields (degrees, minutes, seconds, direction) separated with blanks (space or tab). Within each field, no blanks are allowed to share the numeric value and the unit character. For the unit character, the only following letters are allowed: letter d/m/s. For direction, the only the following letters are allowed: N/n/W/w/S/s/E/e.

Example: "25d 18m 56.2s S"

**Value**

Coordinates in characters
